Docket #E-00000C-11-0328

Dear Arizona Corporation Commission Members,

RECEIVED 11

I have requested that this smart meter be removed from my home and replaced with the old analog meter I had. Before this meter was installed, I had no constant buzzing and ringing in my ears and head. Now I've been having terrible issues with severe anxiety, depression, sleeplessness, headaches not sleeping well and nervous all the time. It's been Maddening!! I couldn't account as to why I was feeling this way, until I finally read about the smart meters and what they are doing to some of the population.

I went to my Doctor and told him "Why am I feeling this way"? I told him that before the smart meter was installed I didn't have these problems. The only notice I received from SRP was in the mail, that they will be replacing my meter and before I could contest it, it was installed...I didn't give it much mind, until I started having these problems. He (doctor) told me that I was EMF sensitive.

I finally got a hold of SRP Ombudsman Randon Wilkins. He offered to replace the smart meter with the analog for a charge of \$20 + tax a month....Well people like me on a very fixed income can't afford even an extra \$5 a month much less \$20.

What is happening here!!!!....I had a perfectly good meter that didn't pulse and send EMF throughout my Home, now I have to pay not just one time, but a monthly charge, just to keep something that I had in the first place?

Here are some points I like to make:

1. With a mesh network design for smart metering, even if you opt out, you will be receiving microwave emissions from the smart meters on your neighbor's homes through the air and coupled with your electrical wiring.
2. This policy is inequitable as it places an **unfair economic burden on people, especially those with fixed incomes like myself and others, to have their analog metering service restored.** The decision to install wireless digital smart meters was made without first getting the permission of the customers.
3. Wireless digital smart meters are an experimental technology. Now that problems related to cost, privacy, health, risk of fire and cyber security have developed, it would be better if the utilities went back to the drawing board and developed a safer technological solution. And, then there needs to be public discussion about how to work together to meet goals for energy efficiency and how best to achieve them. The Arizona Corporation Commission adopted an energy efficiency plan in 2010. However, it does not specify that energy efficiency goals must involve the deployment of wireless digital smart meters.

SRP is a municipal utility and is not regulated directly by the AZCC. However, in practice, it usually adheres to the policies of the AZCC. The AZCC will be considering an opt out policy to be submitted by APS, shortly.
